                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         õ
                                                                                                                     The present sequence represents a beta-amyloid peptide binding protein (BBP). The polynucleotide comprising the entire BBP nucleotide sequence of clone BBP1-f1 is deposited under the accession number ATCC 98617. The polynucleotide comprising a fragment of BBP (nucleotides 202-867 of the full length BBP) of clone pEK196 is deposited as ATCC 98399. Bost cells full length BBP) of clone pEK196 is deposited as ATCC 98399. Bost cells than stormed with a vector comprising the BBP nucleic acid are used for the recombinant production of the protein. The protein can be used for method for diagnosing a disease characterised by aberrant expression of human beta-amyloid protein (BAP). The protein can also be used in a method for screening for compounds which regulate expression of a BAP binding protein. The proteins, antibodies and identified compounds can be used in the treatment or prevention of Alzheimer's disease.

The present sequence is the beta-amyloid peptide (BAP) binding protein-1 (BBP1). It is an integral membrane protein, that traverse the membrane butter. It is related to 6 protein-coupled receptor (GPCR) protein superfamily. It interacts with 6-alpha proteins and regulates the activity of G-protein signalling pathways. BBP genes are widely expressed in neurons. It functions as a suppressor of apoptosis induction. BBP proteins are used as immunogens to raise antibodies, useful as therapeutics and as antigens in solid phase assays. They are also useful as reagents to identify molecules which effect the interaction of BBP and a closed protein, that are useful in the treatment or prevention of diseases associated with apoptosis. The polynucleotides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 AIQEPVNCTNYTAHVSCFPAPNITCKDSSGNETHFTGNEVGFFKPISCHNVNGYSYKVAV 120

                                                                                                                                                                                                                                                                                               Abeta, betaAP)-binding (BBP) proteins and polynucleotides encoding such proteins. BBP sequences are useful to diagnose and/or treat discases associated with aberrant expression of human BAP such as Alzheimer's disease (AD). They are used to generate triansgenic animals. Sequences of the invention are also used in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                      The present invention relates to novel human beta-amyloid peptide (BAP)
                                                                                                                                                                                                                     New human beta-amyloid peptide-binding protein, useful for diagnosing and/or treating diseases associated with aberrant expression of beta-amyloid peptide, e.g. Alzheimer's disease

human secreted proteins, and encode the proteins given in ARV1250 to human secreted proteins, and encode the proteins given in ARV1250 to ARV12514, respectively. The proteins given the signal peptide and an N-terminal fragment of a secreted protein. The nuclein acid sequences can be used for develop products for diagnosis and therapy. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haemalopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, receptor/ligand activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping promoter sequences can also be used for obtaining corresponding promoter activities the nucleic acides encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Secreted protein; human; cytokine; cellular proliferation; cell movement; cellular differentiation; immune system regulator; anti-inflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62 IQEPVNCTNYTAHVSCFPAPNITCKDSSGNETHFTGNEVGFFKPISCRNVNGYSYKVAVA 121

This sequence is encoded by an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as sytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, hemantopoinesis regulators. Itssue growth regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify the breast procedures also useful for constructing a high resolution map of the fuman chiromosches. They can also be used for gene therapy to control or treat genetic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         6 APEAVTARLVGVLWFVSVTTGPWGAVATSAGGEESTKGEDLKVGQYICKDPKINDATGFP 60

AAX41094 to AAX41347 represent 5' expressed sequence tags (ESIs) for human secreted proteins, and encode the proteins given in AAY12261 to AAY12514, respectively. The proteins given represent the signal peptide and an N-terminal tragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proliferation/differentiation activity, hammatopolesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic chemokinetic activity, hammatory activity, chemotactic chemokinetic activity, hammatory activity, tumour inhibition activity or other activities. The products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6 APEAVTARLVGVLWFVSVTTGPWGAVATSAGGEESLKGEDLKVGQYICKDPKINDATQEP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Done disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; demostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.
                                                                                              The present invention relates to novel human beta-amyloid peptide (BAF: Abeta, betaAP)-binding (BBP) proteins and polynucleotides encoding such proteins. BBP sequences are useful to diagnose and/or treat diseases associated with aberrant expression of human BAP such as Alzheimer's disease (AD). They are used to generate transgenic animals. Sequence of the invention are also used in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian sub)ect

                                                                                                                                                                                                                                                                                                                                                                           This invention relates to the DNA and protein sequences of a novel polypeptide-RNA polymerase II subunit II protein. The invention also comprises a process for preparing the polypeptide of the invention by DNA recombination, the application of the polypeptide in treating diseases such as cancer, human immunodeficiency virus (HIV) infection, etc., the antagonist of the polypeptide and its medical action, and the application of the said polymotlectide are disciosed. The present sequence represents the RNA polymerase II subunit II protein of the
                                                                                                                                                                                                                                                                                 Polypeptide-RNA polymerase II subunit 1: and polynuclectide for coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human beta-amyloid peptide-binding protein, useful for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human: bota-amyloid peptide-binding protein: BAP; Abeta: betaAP; BUP:
Alzheimer's disease: AD; transgenic; transgenic animal; gene therapy;
neuroprotective; nootropic.

name and possible regulatory activities; tissue growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activities; heamostatic, thrombolic or chemokinetic activities; heamostatic, thrombolic or thrombolic or involved in oncogenesis, cancer cell proliferation or metastasis. Involved in oncogenesis, cancer cell proliferation or metastasis. Depending on their biological activities; polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders of e.g., within or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, costoporosis), and abnormal vascular growth. Polypeptides involved with tissue reqeneration and repair or nucleic acids encoding them.

The aling (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, batcherial and fungal infections in addition to immune disorders.

Propertial and fungal infections in addition to immune disorders.

Propertial and fungal infections in addition to immune disorders.

Propertial and fungal infections in addition to immune disorders.
                      invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the nuvel polypeptides. and methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which belief to polypeptides of the invention. Although sovel, many of the polypeptides of the invention have homolosy to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may bave various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that can be used to augment or replace cells damaged by liness, autoimmune disease or accidental damage. The polypoptides and nucleotides autoimmune disease or accidental damage. The polypoptides and nucleotides screening techniques. The present sequence represents a novel himan polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Intracellular delivery; transfection agent; cancer; infectious disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         rise to neuroepithelial cells
sequences ABA08225-ABA09574 represent nucleic acids encoding them. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Saps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      il growth. The invention relates to a translection again, comparises a peptitude of a hydrophobic domain, a hydrophilic domain, optionally a spacer sequence between the domains and a functional group conjugated to at least one terminal of the peptide. Peptides of the invention are useful for a non-covalent association with and transport of a heterologous compound into a cell. They are also useful for promoting the callular compound into a cell. They are also useful for promoting the callular internalisation of at least one member e.g. peptide, proteins, antibodies, their derivatives and/or conjugates. They may form part of a pharmaceutical composition to deliver the compound selected from a cancer or an infectious disease, or which targets a cancerous cell or sa cancer or an infectious disease, or which targets a cancerous cell or pathogen-infected cell and to deliver a peptide or inhibitor that a scancer or an infectious disease, or which targets a cancerous cell of isrupts the activity of the enzyme. The agent of the invention has a transfection efficiency of at least 5% for at least two of the members of the group of the compounds and cell types, has a low foxicity, are assy to handle and casy to formulate in conjunction with the many different compound types that it can deliver. The peptides are serum sensitive, thus they bode particularly well for systemic and/or localised in patients. The current sequence represents a new amphipathic peptide control of the invention that contains a cationic nuclear localisation
                                                                                                             Transfection agent that comprises a peptide comprising hydrophobic and hydrophilic domain and having amino acid residues of specified length is useful for a non-covalent association with and transport of a heterologous compound into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAE23685
The invention relates to delivering an agent to a target site in a vertebrate. The method involves (a) loading a red blood cell RBD) with a virus or a virus-like particle (I) comprising an agent, (b) sensitizing RBC to render it more susceptible to disruption than unsensitized RBC; (c) introducing RBC into a vertebrate, and (d) applying energy to release (i). Steps (a) and (b) may be performed in any order. (II) (RBC loaded with a virus or a virus-like particle comprising a therapeutic agent) is useful for the delivery of a thorapeutic agent to a target site in a vertebrate, or in the preparation of a medicoment (or delivery of a therapeutic agent to a target site in a vertebrate. (II) is also useful to redivering one or more agents to a vertebrate and for treating or preventing a disease. The method is useful for delivering or in maging of tissues in vivo or ex vivo, preferably for preventing a disease. The method is useful for delivering an agent to a subcellular organic lessent sequence delivering an agent to a subcellular organic lessent sequence represents a signal sequence based peptide I MPS peptide, a chimera of the hydrophobic terminal domain of viral god1 protekn and the nuclear localisation signal (MLS) from the SV40 large actigen. This Iragment has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0:
                                                                            Delivering agent to target site in vertebrate comprises loading red blood cell with virus or virus-like particle comprising agent, sensitizing cell, introducing cell into vertebrate and applying energy to release virus particle from cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Caps

```
the invention relates to a composition (i) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (1) a vaccine comprising (1). CPP associated with an antigen, and a bharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) antigen-associated with an antigen for disease, and introducing the antigens are, for example, tumour antigen netrs into the cell. The antigens are, for example, tumour antigen derived epitopes recognised by tumour infiltrating lymphocytes (TIL) of FLA (buman inmunity in an animal to a disease, by administering a mature dendritic munnity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following the administration, animal is protected from disease, where the animal comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, tumour, melanoma, thymoma, loukaemia, lymphoma, aarcoma, lung cancer, non-Hodgkin's lymphoma, icukaemia, uterine cancer, cervical cancer, bladder cancer, adenocarcinoma, breast cancer, brostate cancer, covarian cancer and pancreatic cancer, cervical cancer, breacher treatment including surgery, radiation, chemoticrapy or gene ticrapy. The administration of (I), preferably dendritic cell is prior to, subsequent to or concurrent with, the cancer treatment. The present cancer treatment including surgery radiation, clemoticrapy or gene ticrapy. The administration of (I), preferably dendritic cell is prior.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Novel composition for treating a disease in an animal, comprises an immune effector cell and cell penetrating peptide associated with an antigen or antibody \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RNA binding protein; mRNA quantification; gene expression.

The present invention relates to a method of quantifying the expression of target genes in living cells. The method involves preciding cells than possess a target gene of interest which has been tagged with the binding site for an RNA binding protein and a fluorescently labelled RNA binding polypeptide that includes an RNA binding domain and calculating the guantity of target gene expression in the cells using fluorescence signalling techniques. The method is useful for quantifying expression of one or more target genes in living cells which comprise two or more distinct populations of cells. It is used to quantitate the expression Quantifying target gene expression in living cells that possess a target gene of interest tagged with the binding site for an RNA binding protein and fluorescently labeled RNA binding polypeptide including an of any target gene, including expression of protein-encoding messenger RNA genes, ribosomal RNA encoding genes and transfer RNA encoding genes so long as the RNA expression product from the target gene possesses a sequence or structure (the RNA tag) that is bound specifically by the RNA binding polypeptide being used. The present sequence is a fluorescently labelled RNA binding peptide. Claim 45; Page 44; 51pp; Engiish. RNA binding domain

```
The invention relates to a transfection agent comprises a peptide of about 16 - 30 amino acids in length. Peptides of the invention comparise a hydrophobic domain, a hydrophilic domain, optionally a spacer sequence between the domains and a functional group conjugated to at least one terminal of the peptide. Peptides of the invention are useful for a non-covalent association with and transport of a heterologous compound into a cell. They are also useful for prometing the cellular internalisation of at least one member e.g. peptide, proteins, antibodies, their derivatives and/or conjugates. They may form part of a pharmaceutical composition to deliver the compound, selected from a diagnostic or therapeutic compound, to treat at least one condition such as cancer or an infectious disease, or which targets a cancerous cell or pathogen-infected cell and to deliver a peptide or inhibitor that disrupts the activity of the enzyme. The agent of the invention has a transfection efficiency of at least 5% for at least two of the members of the name of the invention has a second of the invention of the invention has a second of the invention that the invention has a second of the invention that the invention tha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  :

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the group of the compounds. The agent has a good delivery efficiency for a broad spectrum of compounds and cell types, has a low toxicity, are easy to handle and easy to formulate in conjunction with the many different compound types that it can deliver. The peptides are serum sensitive, thus they bode particularly well for systemic and/or localised in patients. The current sequence represents a new amphipathic peptide vector of the invention that contains a cationic nuclear localisation
hydrophilic domain and having amino acid residues of specified length
is useful for a non-covalent association with and transport of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Membrane translocation signal, signal sequence based peptide 1, red blood cell vehicle, polypeptide delivery, viral gp41 protein; simian virus 40; SV40; large antigen.

```
The invention describes a method of preparing a red blood cell vehicle suitable for delivering an agent to a target site in a vertebrate comprising providing a red blood cell and loading the red blood cell with an agent-MTS (membrane translocation sequence) conjugate. The red blood cells produced may be used in the preparation of a medicament for delivery of an agent to or at a target site and of one or more agents to a vertebrate. The agent is actively released from the red blood cell vehicle by application of a stimulus to disrupt the red blood cell vehicle. This sequence represents signal sequence based peptide 1, a chimeric peptide of the hydrophobic terminal domain of the viral gp41 protein and the nuclear localisation signal iron simian virus 46 in the invention.
                                              Preparing a red blood cell vehicle suitable for delivering an agent to a target site in a vertebrate due to loading the red blood cell with an agent-membrane translocation sequence

                                                        Sequence 26617, Application US/09252991A

Patent No. 655195

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TILLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSHROWENS
TILLE OF INVENTION: AERUGINOSA FOR DIASNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT PILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 26617
LENGTH: 643
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ن
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2, Application US/09063950C

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
